

Past and Future Impact of Interferometry

> Andreas Quirrenbach Sterrewacht Leiden

### The VLT Interferometer

Ringberg August 2003

# Why Build a Stellar Interferometer?

- To overcome the resolution limitations of conventional telescopes
- To measure the brightest and nearest stars
  - Angular diameters
  - Binary star orbits
  - Limb darkening
  - Stellar surface structure
  - Stellar positions and proper motions
  - Detection of planets
- To constrain theoretical models that describe stellar astrophysics.

• In the near future: also fainter objects (AGN etc.)

Amplitude: 500 pico-radians 100 micro-arcsec

Ringberg August 2003
### Requirements for Astrometric Planet Detection

## Astrometric Measurement with an Interferometer

### **Dual-Star Interferometry**

Ringberg August 2003

# Goals of Astrometric Planet Surveys

- Accurate mass determination for planets detected in radial-velocity surveys (no sin *i* ambiguity)
- Frequency of planets around stars of all masses
  - Relation between star formation and planet formation
- Gas giants around pre-main-sequence stars
  - Time scale of formation, test formation theories
- Coplanarity of multiple systems
  - Test interaction and migration theories
- Search for Solar System analogs
  - Detection of icy or rocky planets

## Planet Detection Capability for 1 µas Astrometric Sensitivity

![](_page_47_Figure_1.jpeg)

Ringberg August 2003

### Distances in the Galaxy

- Calibration of Cepheids and RR Lyrae stars
- Ages of globular clusters and metalpoor stars
- Luminosities of neutron stars and black hole candidates

![](_page_48_Picture_4.jpeg)

#### 10% accuracy at 25 kpc

### **Orbits of X-Ray Binaries**

![](_page_49_Figure_1.jpeg)

#### Ringberg August 2003

#### Andreas Quirrenbach

49

# X-Ray Binary Science with SIM

- Mass function of Black Hole Candidates
- Existence of black holes with  $M \le 5 M_{\odot}$  formed via accretion-induced neutron star collapse?
- Existence of black holes with  $M \ge 20 M_{\odot}$  whose progenitors retained most of their mass until collapse?
- Mass of Neutron Stars: constraints on nuclear equation of state
- Luminosities from parallaxes: test of models (existence of event horizon in BHCs, ADAF models)

# Measuring the Potential of the Galaxy

- Dwarf galaxy is disrupted in potential of the Galaxy
- Measure 6-dim phase space for stars in coherent structures (debris tails)
- Integrate orbits backwards
  ⇒ must retrieve compact dwarf galaxy
- Adjust assumed galactic potential until this is achieved

![](_page_51_Figure_5.jpeg)

### Aerial View of the NPOI Array

![](_page_58_Picture_1.jpeg)

#### Ringberg August 2003

# Interferometric High-Resolution Spectroscopy

- Combination of interferometry with highresolution spectroscopy is very powerful
  - Limb darkening profiles in absorption lines → tests of stellar atmospheres, calibration of projection factors in Cepheid measurements
  - Phase shift across absorption lines  $\rightarrow$  orbits of very close binaries, direct measurement of stellar rotation
  - Surface structure of chemically peculiar stars
  - Trace shocks in Mira atmospheres
- Need  $R \approx 20,000 \dots 100,000$

Ringberg August 2003

## Interferometer Phase across Stellar Absorption Line

![](_page_60_Figure_1.jpeg)

## Combination of Astrometry with Spectro-Interferometry

![](_page_61_Figure_1.jpeg)

# Information from Orientation of Rotation Axis

- Alignment of components in wide binary systems
  - Mechanism of binary star formation
  - Angular momentum distribution in multiple systems
- Orientation of planetary orbit with respect to stellar rotation axis
  - Correlate with planetary masses, orbital eccentricities
  - Probe eccentricity pumping mechanisms

# Spectroscopy of Extrasolar Planets

Andreas Quirrenbach University of California, San Diego

# The DARWIN Interferometer (ESA, after 2012)

![](_page_64_Picture_1.jpeg)

Ringberg August 2003

# Infrared Spectra of Venus, Earth, and Mars

- Venus looks cold ⇒
  cloud cover
- Mars is cold ⇒
  no liquid water
- Earth is warm ⇒
  liquid water and oxygen
- Note presence of CO<sub>2</sub> in all three cases

![](_page_65_Figure_5.jpeg)

### Infrared Spectrum of Earth

![](_page_66_Figure_1.jpeg)

# History of Oxygen in Earth's Atmosphere (Kasting et al.)

![](_page_67_Figure_1.jpeg)

### **Temporal Variation**

 Spectra will vary because of cloud variation, seasonal variation and rotational period; useful information might be derived from these variations.

![](_page_68_Figure_2.jpeg)

# Simulated Spectrum of Exo-Earth Observed with DARWIN

![](_page_69_Figure_1.jpeg)

### Dreams for the Future

Andreas Quirrenbach Sterrewacht Leiden

### ELSA Concept

- Number of telescopes: 20
- Telescope diameter: 10 m
- Maximum baseline: 5 km
- Wavelength range: 500 nm ... 20 µm
- Beam transport: Single-mode fiber bundles
# ELSA Resolution: 20 μas at 500 nm

#### • 30,000 km at 10 pc

- 4 pixels across Jupiter-size object
- 40 pixels across Solar-type star
- 0.2 AU at 10 kpc
  - GR effects on stars very close to the Galactic Center
- 200 AU (1 light-day) at 10 Mpc
  - Images of AGN Broad-line regions
  - Expansion and light echoes of supernovae

## Darwin / TPF ++
